                                                                                                                                                                                                                                                                                                                                                                                                                               ANW19834-43). Claimed CPs, such as fibre proteins, differ from wild-type CPs by the introduction of the UTV and/or spacer at or near the C-terminus. This imparts on the chimeric CP the ability to bind to and enter cells by means of a novel cell surface binding site. Adenoviral vectors comprising the chimeric CP are able to enter cells more efficiently than vectors comprising wild-type CP, especially at lower m.o.i. They are especially useful for gene therapy of e.g. cancers, genetic disorders, pathogenic infections, beat discrete.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Adenoviral vectors containing chimeric coat protein - bind and enter cells more efficiently, useful for gene therapy of e.g. cancer, autoimmune diseases, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Adenovirus; vector; coat protein; gene therapy; gene human; cancer; autoimmune disease; heart disease; ini universal transfer vector; pBSS 75-100 pGS(tat).

                                                                                                                                                                                                                                                                                                                                                herpes simplex virus (HSV), cytomegalovirus (CMV) and non-enveloped virus. Preferably, the peptides are useful for treating or preventing infections from one or more HSVs. The antiviral peptides are used for treating viral infections of the skin or part of the oral or genital cavity. The present sequence is membrane transiting antiviral peptide
                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to peptides comprising membrane transiting peptides with antiviral properties. The peptides are useful for treating or preventing a virus infection in a warm blooded animal, e.g., enveloped viruses such as human immunodeficiency virus (HIV)
                      Membrane transiting peptide; virucide; antiviral; Herpes Simplex Virus; HSV; HIV; Human Immunodeficiency Virus; CMV; cytomegalovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 7; Page 15; 43pp;

The peptides are useful for treating or preventing a virus infection in a warm blooded animal, e.g., enveloped viruses such as human immunodeficiency virus (HIV), herpes simplex virus (HSV), cytomegalovirus (CMV) and non-enveloped virus. Preferably, the peptides are useful for treating or preventing infections from one or more HSVs. The antiviral peptides are used for treating viral infections of the skin or part of the oral or genital cavity. The present sequence is membrane transiting antiviral peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequences given in AAR49574-77 are fragments of the HIV tat protein which were used as transport moleties in the conjugate of the invention. These conjugates are used as cargo molecules for the efficient cytoplasmic and nuclear delivery of biologically active non-tat proteins, nucleat cards and other molecules which are not inherently capable of entering a target cell. The tat basic region amino acid sequence carries cargo molecules by covalent attachment. The reduced size of the transport peptides minimises interference with the biological activity of the cargo molecule. By virtue of the absence of the cysteine-rich region (residues 22-36) of the tat protein, problems of spurious transactivation and disulphide aggregation are solved. The reduced transport peptides size also enhances uptake efficiency.
                                                                                                           21-DEC-1989;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        removing the cysteine-rich region and the carboxy-terminal domain while retaining the basic region. Cargo molecules could be covalently linked to the protein to form a fusion protein without the existing problems of spurious trans-activation and disulphide aggregation. The reduced size of transport polypeptides also minimises interference with the biological activity of the cargo molecule. This is applicable for therapeutic, prophylactic or diagnostic intracellular delivery of small
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents the transport polypeptide Tat38-58GGC which can be used in a novel method for the delivery of biologically active cargo molecules into the cytoplasm and nuclei of eukaryotic cells. The tat protein from immunodeficiency virus (e.g. HIV-1, HIV-2, SIV) is readily taken up into cells when present extracellularly. This polypeptide has been constructed from the HIV-1 tat protein (see AAW31202) by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW26446
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A novel covalently linked chemical conjugate, comprises a transport copyleptide molety consisting of at least residues 49-57 of human immunodeficiency virus (HIV) tat protein, but not residues 22-36 and 73-86, e.g. the present peptide, and a cargo molety comprising a single or double stranded nucleic acid. The conjugate can be used to deliver cargo moleties into the cytoplasm and nuclei of cells to deliver cargo moleties into the cytoplasm and nucleins. The HIV for therapeutic, prophylactic and diagnostic applications. The HIV for reduced size of the transport polypeptides and the cell nucleus. The reduced size of the transport polypeptides minimises interference with the biological activity of the cargo molecule. In addition, by virtue of the absence of the cysteine rich region of the HIV tat protein, the transport polypeptides solve the potential problems of spurious transactivation and disulphide
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Protein (see also AAW26443), plus a Gly-Gly-Cys C-terminal extension. Novel transport proteins comprise modified HIV tat covalently attached to a cargo molecule (see AAW2646-42). The modified tat protein (see AAW26444-49) is characterised by the presence of the tat basic region (amino acids 47-59), and the absence of the Cys-rich region (amino acids 22-36) and the exon 2-encoded C-terminal region (amino acids 73-86). These modifications solve the potential problems of spurious trans-activation and disulphide aggregation, while the reduced size of the transport protein minimises interference with the biological activity of the cargo molecule. NA molecules that encode the modified tat fusion proteins are claimed and can be used to deliver polypoptides or nucleic acids to the cytoplasm or nuclei of cells in vivo or in vitro.

PT

HIV tatt-derived transport fusion proteins - used to deliver proteins of cells contained to the deliver protein protein protein protein protein cytoplasm or nuclei of cells

SX

PT

Specifically into cytoplasm or nuclei of cells

CC

This sequence represents a human immunodeficiency virus (HIV) Type I composed to the cytoplasm and contained to the cytoplasm and contained to cells, for therapeutic, prophylactic or diagnostic purposes. CC This is accomplished by the presence of a small, basic section of tat transport protein of HIV. This is used as it is this protein which is conserved to cause human cells in culture to take up HIV. The method conserved to cause human cells in culture to take up HIV. The method conserved to cause human cells in culture to take up HIV. The method conserved to usually in the form of a fusion protein. The cargo moiety is a human papillomavirus E2 repressor that retains its biological activity cancer delivery into a target cell and where the transport moiety is a human papillomavirus E2 repressor that retains its biological activity concentrations due to use of existing conserved to conserve the cell and 38-72.

CC (c) 38-72, (d) as 38-58, (e) as 37-58, (f) as 47-58, (b) as 47-72, (c) as 47-62 or as 38-62. The proteins allow delivery of specific peptides into cells at high concentrations due to use of existing conserved to cells at high concentrations due to use of existing conserved and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additionally damage cells as they cause physical opening confected and can additional confected and can additional confected and can additional confected and can additional confected and can additional confec

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                     Score

RESULT 3

If kappa chain V region (D44) - mouse
C; Species: Mus musculus (house mouse)
C; Date: 03-Nov-1988 #sequence_revision 03-Aug-1992 #text_change 23-Jul-1999
C; Accession: D30502
R; Eilat, D.; Webster, D.M.; Rees, A.R.
J. Immunol. 141, 1745-1753, 1898
A; Title: V region sequences of anti-DNA and anti-RNA autoantibodies from NZB/NZI
A; Reference number: A30502; MUID:88315787
A; Accession: D30502
A; Status: preliminary
A; Molecule type: mRNA
A; Residues: 1-77 <EIL>
A; Cross-references: CB:M21908; NID:9197073; pTDN:AAA38908.1; PID:9197074
A; Note: the authors translated the codon CAG for residue 48 as Pro
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin
 Ig kappa chain V region - human (fragment)
C;Species: Homo sapiens (man)
C;Date: 24-Jul-1998 #sequence_revision 24-Jul-1998 #text_change 07-May-1999
C;Accession: S70443
R;Cuisinier, A.M.; Fumoux, F.; Fougereau, M.; Tonnelle, C.
Moi. Immunol. 29, 1363-1373, 1992
A;Title: IgM kappa/lambda EBV human B cell clone: an early step of different A;Reference number: S70442; MUID:93024508
A;Accession: S70443
A;Status: not compared with conceptual translation
